Aeon's spectral processing and side-chain audio processing take full advantage of the new 64-bit architecture. These advanced algorithms can be scaled and configured to work with any number of inputs and outputs. With Aeon, sound processing can be accomplished in the space-efficient, time-efficient manner needed for high-performance desktop audio. Visualization, analysis and processing is a difficult task, and has been with us for decades. Until now. Now you can use visualization to probe the unknown regions of sound. You can find connections between sounds, and identify changes and anomalies in your audio using the internal frequency and time-domain analysis. Aeon is the first of the hardware-accelerated AumAudio plug-ins to be released. It has the capability to analyze and process ANY number of inputs at once. Aeon works on any of the operating systems available (Windows, Mac OS, Linux). Aeon can be run as a plug-in to SoundSpectrum's state-of-the-art hardware-accelerated O/S-X2. Combine Aeon with the full range of sound-processing tools (eg. and SoundSpectrum) and you have the potential to see patterns in sound that you could not see with any other approach. Aeon contains special algorithms to enhance the results obtained from SoundSpectrum's analysis, like the Frequency Crosscorrelation Engine and the Frequency Response Graph which enable you to probe the "hidden" components of your sound, the ones you can't hear. Aeon's output can be processed by your favorite DAW or synthesizer. How much do you know about sound? Are you a sound expert or just an interested observer? Are you bored by the boring fact that, no matter how much you listen to music, you always hear a different sound, in a different place? That's because most people can not hear audio at the level of detail it is recorded at, and what they hear is a gross abstraction, the result of some brain filtering. (1) Now you can explore the innermost details of your sound sources. Aeon can be run on ANY system, and you don't need any special hardware. Aeon is the first plug-in to use the new 64-bit AumAudio engine which powers the O/S-X2 version of SoundSpectrum. AumAudio can handle 32 or 64 inputs, so it is the ideal tool for probing and analyzing a large 82157476af
